

Data safety declaration

Answers for the Google Play Console → Policy → App content → Data safety form. Every answer below was derived by reading the Cyber Blast source, schema and network calls — not from the design documents.

Section 1 — Data collection and security

Question	Answer	Basis
Does your app collect or share any of the required user data types?	Yes	The app sends a display name, avatar, country and game results to its own Supabase backend.
Is all of the user data collected by your app encrypted in transit?	Yes	All backend calls are HTTPS to *.supabase.co. Capacitor serves the bundled app over the https scheme; android:allowMixedContent is false, so a plaintext request cannot be made.
Do you provide a way for users to request that their data be deleted?	Yes — by email only	The privacy policy gives a deletion address. There is NO in-app delete button yet. See Section 4.

Section 2 — Data types to declare as COLLECTED

“Shared” in Play’s sense means transferred to a third party. Showing a name on a leaderboard to other players is not sharing, but it is noted below because it is publicly visible and that must be disclosed to users.

Category → Type	Collected · Shared · Req	Purpose	What it actually is
Personal info → Name	Collected · not shared · optional	App functionality	Player-chosen display name, max 12 chars, A–Z 0–9 and space only. Defaults to “ANON”. Visible to other players on leaderboards.
Personal info → Other info	Collected · not shared · optional	App functionality	Two-letter country code for the country leaderboard. Guessed from the device LANGUAGE setting (navigator.languages), never from GPS or IP. User-editable and clearable.
App activity → In-app search history	Not collected	—	No search exists in the app.
App activity → Other actions	Collected · not shared · required	App functionality, Analytics	Game results: score, pieces placed, longest chain, duration, mode, challenge date, plus totals (games played, best score, best chain, daily streak) and in-game XP/currency and league points.
App info & performance → Crash logs	Not collected	—	No crash reporting SDK is present. Revisit if one is added.
App info & performance → Diagnostics	Not collected	—	No analytics or performance SDK is present.
Device or other IDs → Device or other IDs	Collected · not shared · required	App functionality	A random UUID from Supabase anonymous auth, scoped to this app. Not an advertising ID, not a hardware ID, not linked to any Google account. See note in Section 3.

Section 3 — Deliberate “No” answers, and why

Recorded so a future reviewer can tell a considered “No” from an oversight.

Not declared	Reason
Email address, phone, real name	The app has no sign-in. Supabase anonymous auth issues a UUID and nothing else; there is no field anywhere in the app that asks for these.
Approximate or precise location	Country comes from the device language tag, not from IP geolocation or GPS. No location permission is requested and none is in the manifest — INTERNET is the only permission declared.
Photos, videos, audio, files, contacts, calendar	No such permission and no picker. Avatars are twelve built-in images drawn procedurally in code; there is no upload path.
Financial info / purchase history	The app is free with no in-app purchases and no billing library. This MUST be revisited before the planned \$2.99 no-ads purchase ships.
Advertising ID	No ads SDK is present. This MUST be revisited before AdMob is added — adding AdMob changes this form and the ads declaration.
Messages, contacts, health, SMS	The app has no chat, messaging, friend list or social feature of any kind.
The move log used for anti-cheat	Sent to the server, replayed to compute the score, then DISCARDED. It is never written to the database — the runs table has no column for it. Processed ephemerally, so not declarable as collected; disclosed in the privacy policy regardless.
IP address in server logs	Supabase records IP and user-agent in standard server logs. Play's data-type taxonomy has no IP category, so there is nothing to tick — but it IS disclosed in the privacy policy, which is where it belongs.

Section 4 — Open items before this form is submitted

Priority	Item	Action
HIGH	No in-app data deletion	Play requires apps that let users create an account to offer account deletion, including a web request path. Cyber Blast creates an anonymous account automatically, which is a grey area — but the safe reading is to provide it. Recommend a DELETE MY DATA button in the Profile screen calling a delete-account Edge Function. Roughly half a day.
HIGH	Contact email is a placeholder	privacy.html contains “PLACEHOLDER — your contact email” in two places. The policy cannot go live until a real monitored address replaces both.
MED	Privacy policy URL not yet live	Page is written and routed. It publishes to https:///privacy on the next deploy. Paste that URL into Play Console → Store listing and App content.
MED	Ads declaration	Answer “No, my app does not contain ads” for now. This must change the moment AdMob is added, together with the Advertising ID row in Section 2.
LOW	Analytics purpose on game results	“Analytics” is ticked for game results because scores drive leaderboards and league standing. If you prefer the narrowest accurate answer, App functionality alone is defensible; adding Analytics is the more conservative choice and is what is recommended here.

This is a working draft prepared from the source code, not legal advice. You are the data controller and are responsible for the accuracy of what you submit. Play rejects apps whose Data safety answers do not match observed app behaviour, so re-check this document whenever an SDK, permission or backend field is added.
